JOB MARKET PAPER (joint with Philip Schnattinger)

Investing in the Green Transition and Competition from Laggards

We study heterogeneous firms' greening investment decisions and the role of competition between early greening investors and non-investors ("laggards") therein. Empirically we show that firms have a higher propensity to engage in greening investment if they are more productive, less financially constrained and expect positive effects from an economy-wide transformation to climate-neutrality (green transition) on their competitiveness. We incorporate these facts into a dynamic heterogeneous firm model. We show that competition from non-investors keeps aggregate prices and thus idiosyncratic profits low and prevents possible early greening investors from engaging in greening investment. Incorporating expectations about a future green economy with increased competitiveness for early greening investors increases greening investment already today. Furthermore, easing financing constraints by 50% increases the share of greening firms by roughly 20%-points in the early stages of a green transition.
